

Information Form for SJTU Graduate Profession Courses

| Basic Information | | | | |
|------------------------------------|---|----------------------|------------------------|-------------------------|
| * Course Name | Chinese | | | |
| | English Smart Polymeric Materials and Applications | | | |
| * Credits | 2 | * Teaching Hours | 32 1 =16 | |
| * Semester | Fall | * Cross-semester? | No | Spanning over Semesters |
| * Course Type | Elective Course | * Course Type | For full-time students | |
| * Course Category | Specialized Course | Targeting Students | All graduates | |
| * Instruction Language | English | Teaching Method | In class teaching | |
| * Grade | Letter grading | Exam Method | Written Exam | |
| * School | | | | |
| Subject | | | | |
| Person in charge | Name | ID | School | E-mail |
| | | | | clfeng@sjtu.edu.cn |
| Extended Information | | | | |
| * () Course Description | 200 | | | |
| * English Course Description | <p>This intelligent synthetic material with field response ability is the most exciting and interesting new research field, and it is also a new commercial field that has not been developed yet. Although there will be many challenges in this field, polymer materials show great potential in the development of intelligent polymer materials in the future due to their structural designability. Therefore, aiming at the hot resea□ 9</p> <p>of this kind of materials, polymer systems with development trend, etc. In order to enable students understanding of the preparation, modification polymer synthesis, and prepare for the future talents in this field.</p> | | | |

| <p>* English Syllabus</p> | <p>Contents <i>(The time for group discussion and presentation is included in the duration for each unit)</i></p> <p>1 Introduction: Recent advances and challenges in designing stimuli-responsive polymers Synthetic materials capable of responses to external or internal stimuli represent one of the most exciting and emerging areas of scientific interest and unexplored commercial applications. While there are many exciting challenges facing this field, there are a number of opportunities in design, synthesis, and engineering of stimuli-responsive polymeric systems and Mother Nature serves as a supplier of endless inspirations. One 1.5 h classes</p> <p>2 Stimuli-responsive molecular brushes The course focuses on the general aspects of molecular brushes and polymeric responsive systems. Rational approaches to induce stimuli-responsiveness in molecular brush systems are highlighted. One 1.5 h classes</p> <p>3 Stimuli-responsive amphiphilic (co)polymers via RAFT polymerization The course focuses specifically on advances in the synthesis of (co)polymers from water-soluble monomers yielding stimuli-responsive systems. Additionally, we focus on recent reports of assembly into micelles and polymersomes induced by external stimuli including temperature, pH, and ionic strength. Reversible cross-linking methods to " lock " such assembled morphologies are addressed as well as potential applications in nanomedicine. Two 1.5 h classes</p> <p>4 Stimulus-responsive polymer brushes on surfaces: Transduction mechanisms and applications</p> |

This course summarizes selected, recent progress in SRPB applications in the field of surface wettability switching, mechanical actuation, and environmental sensing. Furthermore, we review selected papers from an emerging area in which SRPBs are used for nano- and microfabrication.

one 1.5 h classes

5 Cathodic electrografting of acrylics: From fundamentals to functional coatings

This remarkable progress that largely relies on advanced controlled polymerization processes will be focused, with a special emphasis on the more recent development of smart coatings, particularly stimuli responsive coatings very well-suited to nanotechnologies.

One 1.5 h classes

6 Stimuli-responsive monolayers for biotechnology

This course focus on recent advances in stimuli-responsive materials specifically focusing on monolayers formed by molecules such as peptides and oligonucleotides and their applications in biotechnology.

Two 1.5 h classes

7 Stimuli-responsive nanoparticles, nanogels and capsules for integrated multifunctional intelligent systems

The course consists of two major parts: synthesis and applications of nanoparticles in colloidal dispersions, thin films, delivery devices and sensors. We also broadly discuss potential directions for further developments of this research area.

One 1.5 h classes

8 Biomimetic mechanically adaptive nanocomposites

This course focuses the development of a new family of artificial polymer nanocomposites that mimic the architecture and the mechanic adaptability of the sea cucumber dermis.

Two 1.5 h classes

9 The world of smart healable materials

This course will present a comprehensive view of the field of stimuli-responsive healable materials.

One 1.5 h classes

10 Biomolecular motors at the intersection of nanotechnology and polymer science

This course focuses on the contributions involving the use of linear biomolec
